

# **Public Goods Provision and Upward Intergenerational Occupational Mobility: Empirical Evidence from China**

**ZIMING LI (PRESENTER), ABHINAV ALAKSHENDRA, UNIVERSITY OF  
FLORIDA, U.S.A.**

---

**SHENGFENG LU, AND BO XIONG, WUHAN UNIVERSITY, CHINA**

# intergenerational occupational mobility: What & Why

---

## Definition of social mobility

- Changes in social status between different generations within the same family

## Measurement

- Income or any other index including occupation

## Why

- Occupation > income: social resource, connection, and power
- Income varies longitudinally and regionally, while social evaluation on occupation is comparatively stable

# Problems of social mobility

---

- Less intergenerational mobility (macro)
  - Less incentives to work hard or less input in human capital (micro)
  - Unsustainable economic growth (macro)
- Social stratification and solidification → equity in socialist society?
- How to escape “middle-income trap”? → U-shaped curve of efficiency and equity?

# Research goal

---

- Finding solutions to low intergenerational mobility: from the side of users rather than from provider of public goods
- Answer question
  - Whether enjoying public goods in local community is significant for increasing intergenerational mobility?

# DATA

---

- China Health and Nutrition Survey (CHNS) in 1989, 1991, 1993, 1997, 2000, 2004, 2006 and 2009: 7,200 households with over 30,000 individuals in 15 provinces
- Our sample
  - Nine provinces from Eastern coast (Jiangsu and Shandong), Middle (Henan, Hubei and Hunan), Northeast (Liaoning and Heilongjiang), and Western China (Guangxi and Guizhou)
  - Combining three sub-surveys: Household Survey, Adult Survey, Community Survey
  - Eliminating respondents who are post-retirement employment, students, housewives, or age >65 or <30
  - 13654 paired samples

# Measure intergenerational occupational mobility in 3 ways

- Advanced/middle/lower employment: pyramid of social capital and power, “Hat”, “head” or “hand”
- From informal to formal employment: certainty of income
- From non-public to public employment: certainty of position, reputation, invisible welfare

|          | Variables       | Descriptions   |
|----------|-----------------|--|
| Formal   | <i>advanced</i> | No.01 senior technicians (doctor, professor, lawyer, architect, engineer, etc.),<br>No.03 executive officer and manager (factory director, public official, administration cadre, village cadre, etc.),<br>No.08 military officer and police officer.  |
|          | <i>middle</i>   | No.02 technicians (midwife, nurse, teacher, editor, photographer, etc.),<br>No.04 office worker (secretary and office clerk),<br>No.06 skilled workers (section foreman and craftsmen),<br>No.07 non-skilled workers (housekeeper, cook, doorman, barber, salesman, laundryman, child-care worker, etc),<br>No.12 athlete, actor and performer as manual work. |
| Informal | <i>lower</i>    | No.05 peasant, fisherman, and hunter,<br>No.13 unemployment,<br>No.14 others.  |

# Matrix of intergenerational occupational mobility

| Parent \ Child | Low | Middle | Advanced |
|----------------|-----|--------|----------|
| Low            | 0   | 1      | 2        |
| Middle         | -1  | 0      | 1        |
| Advanced       | -2  | -1     | 0        |

| Parent \ Child      | Informal (Non-public) | Formal (Public) |
|---------------------|-----------------------|-----------------|
| Informal(No-public) | 0                     | 1               |
| Formal(Public)      | -1                    | 0               |

**Value  $\geq 1$**   
Upward mobility

**Value  $\leq -1$**   
Downward mobility

**Value = 0**  
Intergenerational  
solidification

- Parent is the one ranks higher than his/her spouse
- Every child in one household is considered

**TABLE 4**

## General Situation of Intergenerational Occupational Mobility

| <b>Parent's employment</b> | <b>Child's employment</b>    |                          |                            |
|----------------------------|------------------------------|--------------------------|----------------------------|
|                            | <b>Lower employment</b>      | <b>Middle employment</b> | <b>Advanced employment</b> |
| Lower employment           | <u>73.50%</u>                | <u>25.12%</u>            | <u>1.38%</u>               |
| Middle employment          | 28.56%                       | <u>68.00%</u>            | <u>3.44%</u>               |
| Advanced employment        | 23.70%                       | 65.68%                   | <u>10.62%</u>              |
|                            | <b>Informal employment</b>   | <b>Formal employment</b> |                            |
| Informal employment        | <u>73.50%</u>                | <u>26.50%</u>            |                            |
| Formal employment          | 27.31%                       | <u>72.69%</u>            |                            |
|                            | <b>Non-public employment</b> | <b>Public employment</b> |                            |
| Non-public employment      | <u>87.75%</u>                | <u>12.25%</u>            |                            |
| Public employment          | 36.00%                       | <u>64.00%</u>            |                            |

Note: The sample of informal employment is the sample of lower employment.

**TABLE 5**

Intergenerational Occupational Mobility based on Different Categorizations

| <b>Mobility</b> | <b>Advanced/middle/lower employment</b> | <b>Formal/informal employment</b> | <b>Public/nonpublic employment</b> |
|-----------------|---|-----------------------------------|------------------------------------|
| Mobility=-2     | 1.85%                                   | -                                 | -                                  |
| Mobility=-1     | 11.52%                                  | 8.26%                             | 7.77%                              |
| Mobility=0      | 67.37%                                  | 73.25%                            | 82.62%                             |
| Mobility=1      | 18.30%                                  | 18.49%                            | 9.61%                              |
| Mobility=2      | 0.96%                                   | -                                 | -                                  |

**TABLE 6**

## Intergenerational Occupational Mobility in Different Periods

| Mobility (%) | Advanced/middle/lower employment |        |        | Formal/informal employment |        |        | Public/nonpublic employment |        |        |
|--------------|----------------------------------|--------|--------|----------------------------|--------|--------|-----------------------------|--------|--------|
|              | 89~93                            | 97~04  | 06~09  | 89~93                      | 97~04  | 06~09  | 89~93                       | 97~04  | 06~09  |
| <0           | 14.70                            | 12.47  | 11.76  | 7.99                       | 8.21   | 9.11   | 8.48%                       | 8.10%  | 4.89%  |
| =0           | 71.57                            | 64.96  | 61.27  | 79.14                      | 69.85  | 64.79  | 80.08                       | 83.51  | 87.94  |
|              | *53.50                           | *51.52 | *44.45 | *53.50                     | *51.52 | *44.45 | *58.07                      | *75.45 | *84.48 |
| >0           | 13.72                            | 22.57  | 26.97  | 12.87                      | 21.94  | 26.10  | 11.44                       | 8.39   | 7.17   |

Note: The row marked with \* shows the fraction of households especially when both parent and child are in the lowest occupation-based class.

**TABLE 7**

## Intergenerational Occupational Mobility in Urban and Rural Areas

| Mobility (%) | Advanced/middle/lower employment |       | Formal/informal employment |       | Public/nonpublic employment |       |
|--------------|----------------------------------|-------|----------------------------|-------|-----------------------------|-------|
|              | Urban                            | Rural | Urban                      | Rural | Urban                       | Rural |
| =0           | 58.55                            | 70.42 | 70.58                      | 74.18 | 76.52                       | 84.76 |
| >0           | 21.49                            | 18.49 | 19.83                      | 18.03 | 12.56                       | 8.58  |

# Why Accessing to A bucket of public goods: Bucket principle

---

- A bucket of public goods (public education, health, and infrastructure)
  - Basic goods for gaining human entitlement

Public investment and provision  $\neq$  enjoying public goods (welfare)  
(Bucket) (Water)

- Accessing to a bucket of public goods is prior to accessing to a single one
- Accessibility is more basic than the quality of public goods

# Three Differences of Public goods provision

---

- Not all the neighborhoods owns complete basket of public goods
  - Population change and migration vs. lagging planning → difference across urban neighborhoods
  - “Project system” of village finance and local governance → difference across villages
    - e.g. Entitled “Poor village” (Pinkun cun) and entitled “Rich village” (Xiaokang cun) gain extra vertical government transfer and funds
- Urban vs. rural area
  - Better quality and accessibility in urban area
  - Urban-bias policies and dual-sector economy

---

## • Regional differences

- More public investment in Eastern Coast than the other regions
- Western China has the poorest public goods
- Reasons
  - Unbalanced opening-up policy and economic growth rate
  - Different local finance strengths

**TABLE 2****Heterogeneous Provision of Public Goods among Regions**

| <b>Public goods</b> | <b>Northeast China</b> |                   | <b>Eastern China</b> |                   | <b>Central China</b> |                   | <b>Western China</b> |                   |
|---------------------|------------------------|-------------------|----------------------|-------------------|----------------------|-------------------|----------------------|-------------------|
|                     | <b>Mean</b>            | <b>Difference</b> | <b>Mean</b>          | <b>Difference</b> | <b>Mean</b>          | <b>Difference</b> | <b>Mean</b>          | <b>Difference</b> |

*Notes:* The data is from the “China Health and Nutrition Survey” (CHNS) in 1989, 1991, 1993, 1997, 2000, 2004, 2006 and 2009.

- Coverage of public goods in each regions is significantly different from the average value of the other three regions
- Unbalanced difference among different types of public goods

# Model

$$Mobility_{it} = \alpha_0 + \sum_{n=1}^l \beta_n Public_{nit} + \gamma' X' + \sigma_\eta + \varphi_t + \varepsilon_{it}$$

## Logit and probit models

---

$Mobility_{it}$  --- Intergenerational mobility between parent and child

- binary variables (Upward mobility=1, otherwise=0)

$Public_{nit}$  --- Public goods

- Public education: whether enrolled in one of public schools in their neighborhoods/villages, and distance
- Health care services: whether have their own neighborhood/village hospital, and distance
- Public medical insurance: whether being covered by public medical insurance
- Public health: whether have clean public/private toilets and sanitation (sewage and garbage maintenance)
- Public facilities: whether have paved road, bus station, and tap water in their neighborhoods/villages

$X'$  --- Control variables

- Parent's and child's features: education, age, gender of child
- Household feature: annual household income per person, whether in urban area

$\sigma_\eta$   $\varphi_t$  --- Province-fixed and Year-fixed effect

# Results

---

- Significant positive impact of public goods provision on intergenerational mobility
- The nearer from public school and hospital to home, the higher impact
- Negative impact of primary school ← result of merging small primary schools
- Education of Children is important, but parents' education is not
  
- Evaluating the average effect of public goods
  - Method: K-nearest neighbors matching, radius matching, kernel matching
  - Advanced/middle/lower employment, the intergenerational mobility of those with public goods **5.2-31.4%** units higher than that of those with none.
  - Public/non-public employments: **2.1-30.4%** units higher than those without.

# Robustness checks

---

- Population mobility

- Urban residents' school selection and mobility
- Not all the rural migrants is able to access to urban neighborhood
- Method: selecting only rural residences (1384-10644 samples)

Result: positive impact of public goods except primary school and senior high school

- Mlogit and PPOM

- Mobility: -1, 0, 1

- Genetic influence

- Method: selecting parents-in-law and children-in-law, & between adoptive parent and child

# Conclusions

---

- Accessing to the public goods in the local community is beneficial for increasing intergenerational occupational mobility
- Equitable distribution mechanism of public goods
  - Enlarging coverage of public-goods beneficiaries at micro (household/neighborhood) level rather than smoothing regional gap or rural-urban gap in terms of total amount of public goods provision at macro level.
- Future discussion
- Compound effect among different types of public goods

---

Thank you!
